FIBRE OPTIC LINEAR HEAT DETECTION

AP Sensing DTS Fibre Optic Linear Heat Detection

AP Sensing's fiber optic, linear heat detection systems leave no area unmonitored and display the real-time temperature and heat transfer of the entire area at once. Based on the quantum mechanical RAMAN-effect and a patented code-correlation measurement technique AP Sensing's "Linear Heat Series" measures an accurate temperature profile along the optical fiber over several thousand meters with measurements every 10 seconds. With an extremely high level of integration and unique optical assembly technology, AP Sensing offers you full protection combined with worry free permanent operation.

Enabling fast, reliable and cost-effective sensing through highly integrated optical measurement systems. AP Sensing DTS will provide temperature monitoring for;

- Fire Detection
- Power cable monitoring
- Oil & Gas downhole performance monitoring
- Pipeline leakage detection

Suitable applications include large distributed manufacturing facilities, refineries, power plants, silos, warehouses, cold stores, conveyor belt systems, cable trays and tunnels

- Suitable for Harsh and Hazardous areas
- Continuous temperature monitoring
- Ability to integrate into management systems

GENERAL PURPOSE LINEAR HEAT DETECTION

System Sensor Linear Heat Detection

System Sensor's linear heat detection system is a fixed temperature device consisting of the conductor cable and an EOL box.

When heated to the rated temperature, the heat sensitive polymer insulation melts allowing the inner conductors to contact each other initiating an alarm state.

This type of detection is widely used in industrial, petrochemical, refinery and power generation plants.

- Continuous sensitivity along the length of cable
- Easy to install, test and splice

Oil & Gas	Chemical Plants	Power Stations	Waste Water Treatment Plants	Boiler Rooms	Hospitals	Tunnels/Car Parks
<p>The oil and gas industry covers a large number of upstream activities from exploration and production of oil and gas to its transportation, storage and refining. The large amount of highly flammable Hydrocarbon gases involved are a serious explosive risk and additionally toxic gases such as Hydrogen Sulphide are often present.</p> <p>Typical Applications:</p> <ul style="list-style-type: none"> • Exploration Drilling Rigs • Production Platforms • Onshore oil and gas terminals • Refineries <p>Typical Gases:</p> <p>Flammable: Hydrocarbon gases</p> <p>Toxic: Hydrogen Sulphide, Carbon Monoxide</p>	<p>Probably one of the largest users of gas detection equipment are Chemical Plants. They often use a wide range of both flammable and toxic gases in their manufacturing processes or create them as by-products of the processes.</p> <p>Typical Applications:</p> <ul style="list-style-type: none"> • Raw material storage • Process areas • Laboratories • Pump rows • Compressor stations • Loading Areas <p>Typical Gases:</p> <p>Flammable: General Hydrocarbons</p> <p>Toxic: Various including Hydrogen Sulphide, Hydrogen Fluoride and Ammonia</p>	<p>Traditionally coal and oil have been used as the main fuel for Power Stations. In Europe and the US most are being converted to natural gas.</p> <p>Typical Applications:</p> <ul style="list-style-type: none"> • Around the boiler pipe work and burners • In and around turbine packages • In coal silos and conveyor belts in older coal/oil fired stations <p>Typical Gases:</p> <p>Flammable: Natural Gas, Hydrogen</p> <p>Toxic: Carbon Monoxide, SOX, NOx and Oxygen deficiency.</p>	<p>Waste Water Treatment Plants are a familiar site around many cities and towns. Sewage naturally gives off both Methane and H2S. The 'rotten eggs' smell of H2S can often be noticed as the nose can detect it at less than 0.1ppm.</p> <p>Typical Applications:</p> <ul style="list-style-type: none"> • Digesters • Plant sumps • H2S Scrubbers • Pumps <p>Typical Gases:</p> <p>Flammable: Methane, Solvent vapours</p> <p>Toxic: Hydrogen Sulphide, Carbon Dioxide, Chlorine, Sulphur Dioxide, Ozone.</p>	<p>Boiler Rooms come in all shapes and sizes. Small buildings may have a single boiler whereas larger buildings often have large boiler rooms housing several large boilers.</p> <p>Typical Applications:</p> <ul style="list-style-type: none"> • Flammable gas leaks from the incoming gas main • Leaks from the boiler and surrounding gas piping • Carbon Monoxide given off badly maintained boiler. <p>Typical Gases:</p> <p>Flammable: Methane</p> <p>Toxic: Carbon Monoxide</p>	<p>Hospitals may use many different flammable and toxic substances, particularly in their laboratories. Additionally, many are very large and have onsite utility supplies and backup power stations.</p> <p>Typical Applications:</p> <ul style="list-style-type: none"> • Laboratories • Refrigeration plants • Boiler rooms <p>Typical Gases:</p> <p>Flammable: Methane, Hydrogen</p> <p>Toxic: Carbon Monoxide, Chlorine, Ammonia, Ethylene oxide and Oxygen deficiency</p>	<p>Car Tunnels and enclosed Car Parks need to be monitored for the toxic gases from exhaust fumes. Modern tunnels and car parks use this monitoring to control the ventilation fans. Tunnels may also need to be monitored for the build up of natural gas.</p> <p>Typical Applications:</p> <ul style="list-style-type: none"> • Car tunnels • Underground and enclosed car parks • Access tunnels • Ventilation control <p>Typical Gases:</p> <p>Flammable: Methane (natural gas), LPG, LNG, Petrol Vapour.</p> <p>Toxic: Carbon Monoxide, Nitrogen Dioxide</p>
